# PantryTrace

## Every recall decision needs a receipt

Internal recall triage for food-bank coordinators

**SOLVING FRAGMENTED INTELLIGENCE**

Declared pre-event prototype | Prepared 19 October 2026 | All operational records are synthetic

# A notice starts the investigation

The coordinator still has to inspect stock, find the lot records and identify partner transfers.

## Notice

Product identity
Affected lots

## Stock

Supplier alias
Missing lot

## Transfers

Partner location
Quantity moved

**Partner-agency guidance requires inventory inspection and quarantine of recalled product.**

Source: Foodbank of Southeastern Virginia and the Eastern Shore, Partner Agency Manual, January 2026, recall section. foodbankonline.org/wp-content/uploads/2026/01/PAM-Jan-2026.pdf

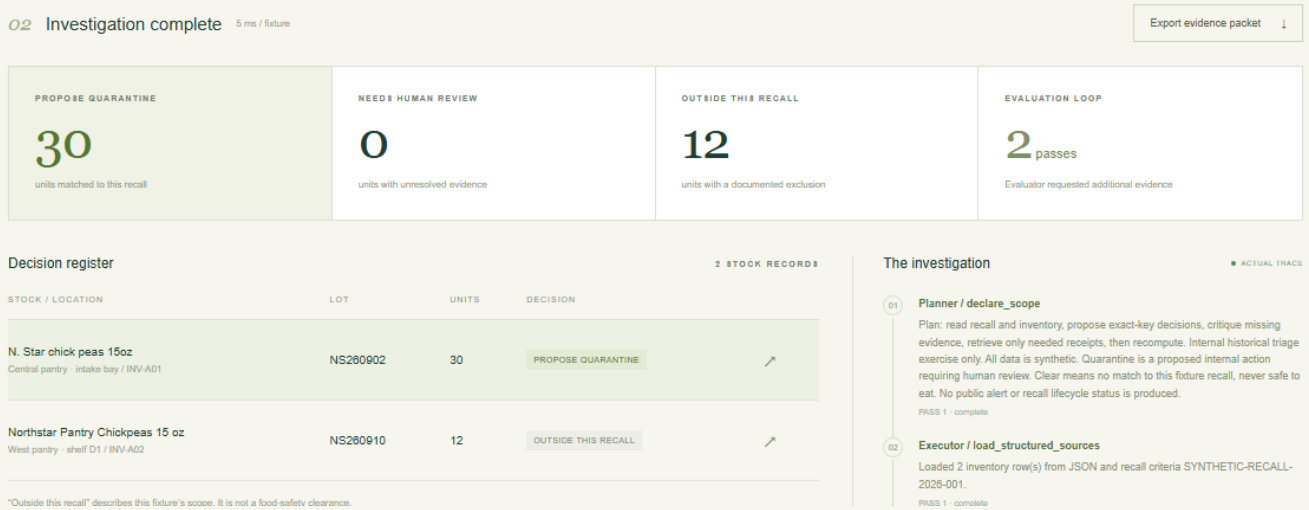

# A missing lot becomes a solvable question

## 36 = 30 + 6

received on hand transferred

An exact batch join and supplier alias resolve lot NS260902.

30 on-hand units proposed for quarantine.
6 outbound units retained separately.

Actual workbench: missing lot, receipt retrieval, then a supported internal draft.

Synthetic fixture proof: data/intake_ledger.csv LEDGER-A01; inventory INV-A01; transfer TRANSFER-A01. Direct outbound transfers only. No action is executed.

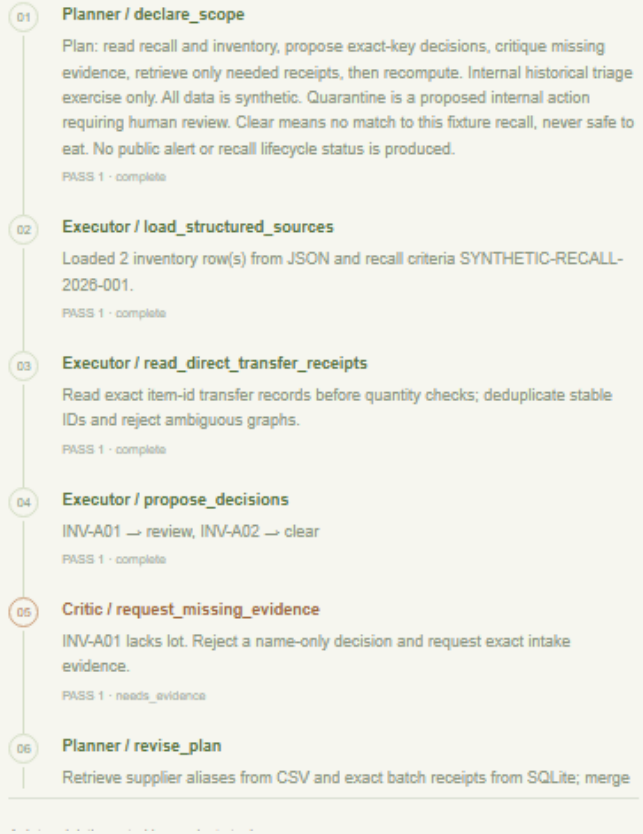

# The critic changes the plan

01 Propose from available stock records

02 Critic identifies the missing lot

03 Query alias and exact intake batch

04 Recompute, or retain human review

Bounded deterministic roles share evidence and retry.
The current controller does not claim LLM autonomy.

Actual local execution trace from the synthetic ambiguous case. Pattern references: ReAct (arxiv.org/abs/2210.03629), Self-RAG (arxiv.org/abs/2310.11511); these methods are not reproduced.

# Conflicting receipts stay unresolved

**18**

units require human inspection

**10**

units match an affected lot

Two receipts disagree about the same batch. The system keeps both records and requests a physical label check.

Every operational action remains an internal draft for a person to approve.

Executed synthetic conflict case: INV-C01; LEDGER-C01 vs LEDGER-C02. INV-C02 matches lot NS260902. No food-safety clearance or public recall alert is produced.

# Measured on the declared development set

**9 / 9**

development items correct after evidence retrieval

**8 / 9**

inventory-only baseline

## 44 automated tests pass

Four authored synthetic scenarios. This regression set is not an independent holdout or a real-world accuracy estimate.

Proof: python -m pantrytrace evaluate; python -m unittest discover -s tests -v. The baseline is the same controller before missing-evidence retrieval. Results checked 19 October 2026.

# Sponsor proof, stated precisely

| | |
|---|---|
| Meterless | **VERIFIED LOCALLY**<br>Official H-MEM remember, recall, audit and feedback |
| Zetaris | **LIVE INSTANCE PENDING**<br>Read-only adapter and explicit connected-record path |
| NVIDIA | **NO LIVE CALL**<br>Optional critique adapter; contribution unmeasured |
| Cursor | **ACTUAL USE PENDING**<br>Required eligible-window development still to complete |

Proof: artifacts/meterless-smoke.json; official H-MEM commit a3f15cee1b108c436827cdd10740fd113016e354. Remote API calls in that smoke check: 0. See docs/sponsor-integration-research.md for provider contracts.

# Prepared openly.
# Built during the window.

**19 OCT 2026**

Declare this pre-event prototype, code, fixtures and media.

**22 OCT 2026, 05:30 IST**

Build opens. Complete new work in Cursor and capture the proof.
